

SIMStation Extensions/Add-Ons

SIMStation Voice of Patient

SIMStation Voice of Patient provides your manikin with a voice which can be broadcast and recorded using the SIMStation-System. The sound quality is significantly higher than that achieved with speakers integrated into the simulators. The push-to-talk microphone is connected to the control PC in the control room. Using Bluetooth technology, the sound is then broadcast from the VOP-Box to the battery-powered speaker which can be placed directly at the head of the patient.

SIMStation Wireless Camera Kit

The intelligent, flexible camera solution by SIMStation: A wireless camera with a long-life battery and Magic Arm. It enables cable-free working for up to 8 hours. The battery is charged with a standard mini USB power supply.

SIMStation Media Screen

The SIMStation Media Screen is a Microsoft Surface Tablet running SIMStation software which can be placed in the training room. Using a cable-free connection, data such as X-rays and blood test results, videos, PDFs or PowerPoint presentations etc. can be easily transmitted from the control room to the tablet in the training room during the simulation. In order to display the media on larger devices, external screens or TVs can be connected using the HDMI port.

SIMStation Telephone Recording

A new tool from SIMStation is used for transmitting and recording telephone calls during simulation trainings, for example during calls to control centers, laboratories, emergency teams in the house, relatives or to doctors with on-call duty. The system was primarily developed for control stations since the most important communication frequently takes place over the telephone.
